

Data Structure

a CakeType is a **flavor**, **layers**, & **is-iceCream**

data **CakeType**:

```
|  cake( _____  
          _____  
          _____  
          is-iceCream :: Boolean _____)
```

end

To make examples of this structure, I would write:

cake1 = _____

cake2 = cake("Red Velvet", 2, true)

To access the fields of **cake2**, I would write:

```
_____ cake2.flavor  
_____ cake2.layers  
_____ cake2.is-iceCream
```
