### Unit 1

- Many important questions ("what's the best restaurant in town?", "is this law good for citizens?", etc.) are answered with data. Data Scientists try and answer these questions, by writing programs that ask questions of data.
- Data of all types can be organized into **Tables**
- Every Table has a header row, and some number of data rows
- **Quantitative data** is data usually numeric that measures *quantity*, such as a person's height, a score on test, a measure of distance, etc. A list of quantitative data can be ordered from smallest to largest.
- Categorical data is data that specifies categories, such as eye color, country of origin, etc. A list of categorical data has no notion of "smallest" or "largest", and cannot be ordered.
- **Programming languages** involves different *datatypes*, such as Numbers, Strings, Booleans and Images.
- Operators (like +, -, \*, <, etc.) are written between values. For example: 4 + 2
- **Functions** (like triangle, star, string-repeat, etc.) are written first, followed by a list of **arguments** in parentheses. For example: star(50, "solid", "red")
- **Examples** help programmers reason about their code. Every example contains two expressions, and the example "passes" if both expressions evaluate to the same thing. For example: 4 + 2 is 6, or "cat" == "dog" is false

# Numbers and Strings

Make sure you've loaded the Unit 1 Starter File, and clicked "Run".

- 1. Try typing 42 into the Interactions Area and hitting "Enter". What happens?
- 2. Try typing in other Numbers. What happens if you try a decimal like 0.5? A fraction like 1/3? Try really big Numbers, and really small ones.
- 3. String values are always in quotes. Try typing your name (in quotes!). What happens when you hit "Enter"?
- 4. Try typing your name with the opening quote, but without the closing quote. What happens? Now try typing it without any quotes.
- 5. Is 42 the same as "42"? Why or why not? Write your answer below:

# Operators

- 6. Just like in math, Pyret has operators like + and -. Try typing in 4 + 2, and then 4+2 (without the spaces). What can you conclude from this? Write your answer below:
- 7. Try typing in 4+2+6, 4+2\*6, and 4+(2\*6). What can you conclude from this? Write your answer below:
- 8. Try typing in 4 + "cat", and then "dog" + "cat". What can you conclude from this? Write your answer below:

### Booleans

Boolean expressions are yes-or-no questions, and will always evaluate to either true ("yes") or false ("no"). What will each of the expressions below evaluate to? Write down the result in the blanks provided, and type them into Pyret if you're not sure.

| 3 <= 4 | <br>"a" > "b"  |  |
|--------|----------------|--|
| 3 == 2 | <br>"a" <> "b" |  |
| 2 <> 4 | <br>"a" == "b" |  |
| 3 <> 3 | <br>"a" <> "a" |  |

### **Boolean Operators**

Pyret also has operators that work on *Booleans*. For each expression below, write down your guess about what it will evaluate to. Then type them in and see if you were right!

- How many different Number values are there in Pyret?
  \_\_\_\_\_\_
- 2. How many different String values are there in Pyret?
- 3. How many different Boolean values are there in Pyret? \_\_\_\_\_

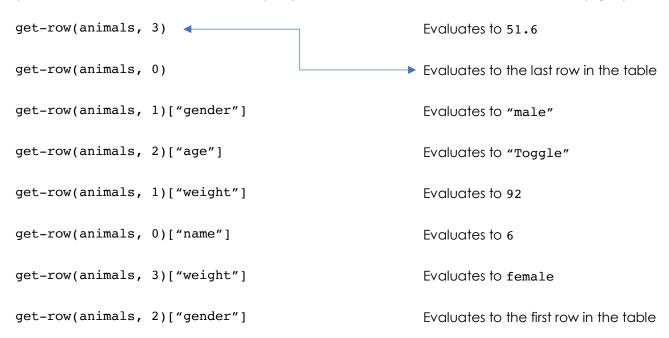

# Lookups

The table below represents four animals at the shelter:

#### animals

| name     | gender           | age | weight |  |
|----------|------------------|-----|--------|--|
| "Toggle" | "female"         | 3   | 48     |  |
| "Fritz"  | "Fritz" "male" 4 |     | 92     |  |
| "Nori"   | "female"         | 6   | 35.3   |  |
| "Maple"  | "female"         | 3   | 51.6   |  |

1) Match each Pyret expression (left) to the description of what it looks up(right).

2) Fill in the blanks (left) with the Pyret lookup code that will produce the value (right).

| a. get-row(animals, 3)["name"] | "Maple" |
|--------------------------------|---------|
| b.                             | male    |
| С.                             | 4       |
| _d.                            | 48      |
| e.                             | "Nori"  |

# Writing Examples

In the examples block below, put an "X" next to the examples that will <u>fail</u>.
 Remember: examples only pass if the left- and right-hand expressions evaluate to the same value!

```
examples:
    1 + 2 + 9
    num-sqrt(16)
    is 2 + 2
    3 > 99
    is true
    square(10, "solid", "red")
end

is 19
is 2 + 2
is true
is rectangle(10, 10, "solid", "red")
end
```

2. In the examples block below, fill in the blank on the right-hand side so the example will pass.

3. The examples block below refers to the shapes table on the right, using row-accessors and the get-row function. For each example, fill in the blank so the example will pass.

| name       | corners | Is-round |
|------------|---------|----------|
| "triangle" | 3       | false    |
| "circle"   | 0       | true     |
| "ellipse"  | 0       | true     |
| "square"   | 4       | false    |

### Unit 2

**Answering Questions from Data** can take many forms. Here are a few types of questions, each requiring a different kind of analysis:

- **Lookup Questions** can be answered just by finding the right row and column a table. (e.g. "How old is Toggle?")
- Compute Questions can be answered by computing over a single row or column. (e.g. – "What is the heaviest animal at the shelter?")
- **Analyze Questions** require looking for trends across multiple rows or columns. (e.g. "Do cats tend to be adopted sooner than dogs?")

**Threats to Validity** can undermine a conclusion, even if the analysis was done correctly. Some examples of threats are:

- **Selection bias** identifying the favorite food of the rabbits won't tell us anything reliable about what all the animals eat.
- Sample size averaging the age of only three animals won't tell us anything reliable about the age of animals at the shelter!
- **Sample error** surveying dogs when they are puppies won't tell us anything reliable about overall dog behavior, since their behavior changes as they age.
- **Confounding variables** if they person surveying the animals has a piece of bacon in their pocket, they will incorrectly find that all dogs are friendly!

# The Animals Dataset

| 2. | This dataset is Animals from an animal shelter  Some of the columns are (Choose a few columns from the dataset, and write the column names in the shaded boxes below Then copy three sample rows, and write the datatype and whether it contains Qualitative or Categorical data in the bottom two rows.) |                |                            |                                   |   |                         |  |  |  |
|----|---|----------------|----------------------------|-----------------------------------|---|-------------------------|--|--|--|
|    | Headers   |                |                            |                                   |   |                         |  |  |  |
|    | Sample 1  |                |                            |                                   |   |                         |  |  |  |
|    | Sample 2  |                |                            |                                   |   |                         |  |  |  |
|    | Sample 3  |                |                            |                                   |   |                         |  |  |  |
|    | Datatype  |                |                            |                                   |   |                         |  |  |  |
|    | Quantitative or Categorical?  |                |                            |                                   |   |                         |  |  |  |
| 3. | For the question  |                | eck the box                | x to the left of                  | the question  | s you <u>CAN</u> answer |  |  |  |
|    | Question?   |                |                            |                                   |   |                         |  |  |  |
|    | How old is N  | ori?           |                            |                                   |   |                         |  |  |  |
|    | What color i  | s Snowcone'    | s fur?                     |                                   |   |                         |  |  |  |
|    | What is the average age of the animals in the table?  |                |                            |                                   |   |                         |  |  |  |
|    | what is the c   | average age    |                            |                                   | Are there more fixed or unfixed animals in the table? |                         |  |  |  |
|    |   |                |                            | als in the tab                    | le?   |                         |  |  |  |
|    | Are there me  | ore fixed or u | ınfixed anim               | nals in the tab<br>to adopt kitte |   |                         |  |  |  |
| 4. | Are there me  | ore fixed or u | nfixed anim<br>more likely | to adopt kitte                    |   |                         |  |  |  |

### What Questions Can You Answer?

The following is a dataset of a bicycle rider's training rides.

| date       | miles | time | weather  | average<br>speed | max<br>speed |
|------------|-------|------|----------|------------------|--------------|
| 04/10/2018 | 10    | 44   | "cloudy" | 13               | 30           |
| 05/30/2018 | 15    | 66   | "sunny"  | 13.5             | 22           |
| 06/12/2018 | 12    | 61   | "rainy"  | 11.2             | 25           |
| 06/22/2018 | 15    | 61   | "cloudy" | 13               | 28           |
| 07/04/2018 | 24    | 103  | "sunny"  | 14               | 26           |
| 07/12/2018 | 24    | 120  | "windy"  | 12.5             | 26           |

**What <u>can</u> you answer?** For each of the following questions, check the box to the left of questions you <u>can</u> answer. For each *checked* question, write whether the question is a **lookup**, **compute**, or **analyze** question.

| Question  | Lookup, Compute or Analyze? |
|---|-----------------------------|
| What is the cyclist's average speed across all rides?               |                             |
| How many miles did they ride in June?                               |                             |
| What is the tallest hill this cyclist climbed?                      |                             |
| Does this cyclist ride slower when it is rainy?                     |                             |
| Does this cyclist ride faster when they are late to an appointment? |                             |

**What <u>can't</u>** you answer? For each of the following questions, check the box to the left of questions you <u>cannot</u> answer. For each *un-checked* question, write whether the question is a **lookup**, **compute**, or **analyze** question.

| Question  | Lookup, Compute or Analyze? |
|---|-----------------------------|
| What tire pressure produces the highest avg speed?            |                             |
| What is the avg time it takes this cyclist to ride 1mi?       |                             |
| Does this cyclist ride more in April or July?                 |                             |
| What is the average temperature while this cyclist is riding? |                             |
| How many flat tires did this cyclist fix in June?             |                             |

# Threats to Validity

Some volunteers from the animal shelter surveyed a group of pet owners at a local dog park. They found that almost all of the owners were there with their dogs, and from this survey they concluded that dogs are the most popular pet in the region.

| What are some possible threats to the validity of this conclusion?   |
|--|
|  |
|  |
|  |
|  |
|  |
| The animal shelter noticed a large increase in pet adoptions between Thanksgiving and Valentines Day. They conclude that at this current rate, there will be a huge demand for pets this Spring.  What are some possible threats to the validity of this conclusion? |
|  |
|  |
|  |
|  |
|  |

# Threats to Validity

The animal shelter wanted to find out what kind of food to buy for their animals. They took a random sample of two animals and the food they eat, and found that spider and rabbit food was by far the most popular cuisine!

| What are some possible threats to the validity of this conclusion?   |
|--|
|  |
|  |
|  |
|  |
|  |
| A volunteer opens the shelter in the morning and walks all the dogs. At mid-day, another volunteer feeds all the dogs and walks them again. In the evening, a third volunteer walks the dogs a final time, and closes the shelter. The volunteers report that the dogs are much friendlier and more active at mid-day, so the shelter staff assume the second volunteer must be better with animals then the others.  What are some possible threats to the validity of this conclusion? |
|  |
|  |
|  |
|  |
|  |

# My Dataset

| 1. | My dataset is _  |                |                  |               |                 |               |
|----|--|----------------|------------------|---------------|-----------------|---------------|
| 2. | Some of my co<br>(Copy six columns<br>contains Qualitati | from your date | aset, and for ea |               | its datatype, a | nd whether it |

|    |  |                |                  |               |                 |               |
|    |  |                |                  |               |                 |               |
|    |  |                |                  |               |                 |               |

### Unit 3

- Programming languages let us **define our own function**.
- We use the **Design Recipe** to help us define functions without making mistakes.
- The first step is to write a **Contract** and **Purpose Statement** for the function, which specify the Name, Domain and Range of the function and give a summary of what it does.
- The second step is to **write at least two examples**, which show how the function should work for specific inputs. These examples help us see patterns, and we express those patterns by **circling and labeling** what changes.
- The final step is to **define the function**, which generalizes our examples.

# The Design Recipe

Define a function called is-fixed, which tells us whether or not an animal is fixed

|      | is-fixed         | ::              | (animal :: Row)     | $\rightarrow$  | Boolean             |
|------|------------------|-----------------|---------------------|----------------|---------------------|
|      | name             | ••              | domain              |                | range               |
| # Cc | ensumes an anima | al, and produce | es the value in the | e fixed column |                     |
|      | mples:           |                 |                     |                |                     |
|      | is-fixed         | (sasha          | ) is                | sasha["fi      | xed"]               |
|      | <del></del>      | (               | ) is                |                |                     |
| end  |                  |                 |                     |                |                     |
| fun  |                  | (               | ) :                 |                |                     |
| end  |                  |                 |                     |                |                     |
|      | ender of that an |                 | vilicii consumes (  |                | mals table tells us |
|      | name             | ::              | domain              | ~ _            | range               |

### Unit 4

- **Methods** are special functions that are attached to pieces of data. We use them to manipulate Tables.
- They are different from functions in several ways:
  - Their names can't be used alone: they can only be used as part of data, separated by a dot. (For example, animals.order-by)
  - o Their contracts are different: they include the type of the data as part of their names. (eg, .order-by :: (column :: String) → Table)
  - o They have a "secret" argument, which is the data they are attached to
- We will use three **Table Methods** to manipulate our datasets:
  - o <Table>.order-by order the rows of a table based on a column
  - o <Table>.filter create a subset of the data, with only certain rows
  - o <Table>.build-column use the columns of a table to make a new one

# Reviewing Functions

| 1. | Definitions Area.   | ттріе ін тте |
|----|---|--------------|
| 2. | How many values are defined in this file?                               |              |
| 3. | How many functions are defined in this file?                            |              |
| 4. | What is the name of the last function?                                  |              |
| 5. | What is the Domain of the last function?                                |              |
| 6. | What is the Range of the last function?                                 |              |
| 7. | What is the variable name that the last function uses?                  |              |
| 8. | Which function will tell us if an animal is a kitten?                   |              |
| 9. | Which function will print out " <name> the <species>"?</species></name> |              |
| 10 | .Which function will tell us if an animal is a dog older than 10?       |              |
| 11 | .Which function will tell us if an animal has been fixed?               |              |
| 12 | .Which function will draw a nametag for an animal?                      |              |

# Plans for the Animals Dataset

| What are two ways you might want to order the animals dataset?             |
|--|
| 1)   |
|  |
|  |
| 2)   |
|  |
| What are two subsets into which you might filter the animals dataset?      |
| 1)   |
|  |
|  |
| 2)   |
|  |
| What are two new columns you might want to build from the animals dataset? |
| 1)   |
|  |
|  |
| 2)   |

#### Methods

Methods are a lot like functions, but they differ in three important ways:

- They can only be called as **part of a value**, using the **dot-accessor**. For example: in **animals**.row-n (2), the row-n method is part of the animals table.
- Their Contracts are different, because they contain a **Type** as part of their name. For example: <**Table>**.row-n :: (index :: Number) -> Row
- They have a "secret argument", which is the value they are attached to. In the examples above, the row-n method consumes only a Number as part of its Domain, but it also consumes the Table to which it is attached.

Here is the Contract for a different method, which consumes the name of a food and produces True if the person likes that food:

|    | <person>.likes :: (food :: String) → Boolean</person>                         |
|----|---|
| 1. | What Type of data is the method attached to?                                  |
| 2. | What is the name of this method?  |
| 3. | How many things are in its Domain?  |
| 4. | What is the name of the argument in its Domain?                               |
| 5. | What is the Type of the argument in its Domain?                               |
| 6. | What Type of data will this method will produce?                              |
| 7. | Below are 3 expressions. Based on the contract above, circle the correct one. |
|    | emma.likes("pizza") likes("pizza") likes(emma, pizza)                         |

8. On the line below, write your own expression that uses this method, replacing emma and "pizza" with your own name and a food you like.

# Playing with Methods

You have the following functions defined below (read them carefully!):

```
fun is-fixed(animal): animal["fixed"] end
fun is-young(animal): animal["age"] < 4 end
fun nametag(animal): text(animal["name"], 20, "red") end</pre>
```

The table **t** below represents four animals at the shelter:

| name     | gender   | age | fixed | weight |
|----------|----------|-----|-------|--------|
| "Toggle" | "female" | 3   | true  | 48     |
| "Fritz"  | "male"   | 4   | true  | 92     |
| "Nori"   | "female" | 6   | true  | 35.3   |
| "Maple"  | "female" | 3   | true  | 51.6   |

Match each Pyret expression (left) to the description of what it does (right).

| t.order-by("age", true)   | Produces a table containing only  Toggle and Maple                         |
|---|--|
| t.filter(is-fixed)  | Produces a table, sorted oldest-to-<br>youngest.                           |
| t.build-column("sticker", nametag)                                    | Produces a table, sorted youngest-to-<br>oldest                            |
| t.filter(is-young)  | Produces a table with an extra column, named "sticker"                     |
| t.order-by("age", false)  | Produces a table containing Maple and Toggle, in that order.               |
| <pre>t .filter(is-young) .order-by("weight", false)</pre>             | Produces a table containing the same four animals.                         |
| <pre>t .order-by("age", true) .build-column("sticker", nametag)</pre> | Produces a table with an extra "sticker" column, sorted youngest-to-oldest |

# Unit 5

- Functions can contain value definitions
- We use **Table Plans** to help us use table methods correctly, without making mistakes:
  - o Like functions, we start with a Contract and Purpose Statement
  - But instead of writing programmed examples, we sketch out Start and End Tables, based on the Contract and Purpose.
  - o Then we define the function based on our Start and End Tables. Every function includes both the table definition (using methods) and a table expression.

#### Review

- In the Interactions Area, use table methods to sort your table by one column. Try
  sorting your table in both ascending and descending order.
- If a researcher is looking at a dataset of students, they might want to divide the data into separate populations of boys and girls. A veterinarian might want to look at only the cats at a shelter. Come up with one criteria you could use for animals at the shelter, and describe it below.

• In the space below, use the Design Recipe to write a function that checks if a row in your dataset fits that criteria. Whatever criteria you choose, it should be true for some rows and false for others. Type this function into the Definitions Area.

|       |       | :: |        | $\rightarrow$ |       |
|-------|-------|----|--------|---------------|-------|
| #     | name  |    | domain |               | range |
| examp | oles: |    |        |               |       |
| _     |       | _( | _) is  |               |       |
| _     |       | _( | _) is  |               |       |
| end   |       |    |        |               |       |
| fun _ |       | (  | _) :   |               |       |
| end   |       |    |        |               |       |

- Use the function to filter your dataset in the interactions window.
- Instead of using the function you wrote to filter your dataset, use a different table method to build a new column that shows whether or not each row meets the criteria.

On Kitten Day, the shelter prints up a list of all the cats in their database that are less than 2 years old, and makes nametags for them. They need a function that will help them out! Define a function called get-kittens-tags, which takes in the dataset and produces the correct table.

| nake a Start Table and a resu  | t based on th |
|--|---------------|
| nimals-table   |               |
| Nake a Start Table and a resunimals-table  |               |
| Make a Start Table and a resu  animals-table  name   species   age   fixed   leg |               |
|  |               |
| name species age fixed leg   |               |
|  | weight adop   |
| Sasha cat 1 FALSE 4  | 6.5 4         |
| Toggle dog 3 TRUE 4  | 48 3          |
| Buddy lizard 2 FALSE 4   | 0.3 12        |
| Wade cat 1 FALSE 4   | 3.2 4         |
| Mittens cat 2 TRUE 4   | 7.4 5         |

The first weekend of every month, the shelter holds a "meet the dogs" picnic, to encourage families to adopt their dogs. Write a function called get-dogs-by-age, that takes their database and produces a table of all the dogs in the shelter, sorted from youngest to oldest.

| Contract                       | and Pu    | rpos     | е         |       |          |         |               |         |          |          |        |          |       |         |          |

It's important for animals to stay healthy, especially when they get older. The veterinarians at the shelter want to put some of the dogs on a diet! They need a regular report of all the older dogs, sorted from heaviest-to-lightest. Define a function old-dogs-diet, which does just that!

The shelter is tracking birth-years for all the animals who've been fixed. They need a function that takes in their database and returns a table that contains the birth-year for each one. Define get-fixed-birth that will do this for them.

# My Dataset

| What are two ways you might want to order this dataset?             |
|---|
| 1)  |
|   |
|   |
| 2)  |
|   |
|   |
| What are two subsets into which you might filter this dataset?      |
| _1)   |
|   |
|   |
| 2)  |
|   |
| What are two new columns you might want to build from this dataset? |
|   |
|   |
|   |
|   |
| 2)  |

### Unit 6

- **Bar charts** show the *absolute* quantity of each row in a dataset. The larger the quantity, the longer the bar. Bar charts provide a visual representation of values in a dataset.
- **Pie charts** show the *relative* quantity of each row in a dataset. The greater the percentage, the larger the pie slice. Pie charts provide a visual representation of proportions in a dataset.
- Choosing a Sample Table is important when coming up with small examples for Table Plans. A good sample table has:
  - At least all the relevant columns
  - Enough rows to accurately represent the dataset
  - Rows that are randomly-ordered

## Statements about Columns

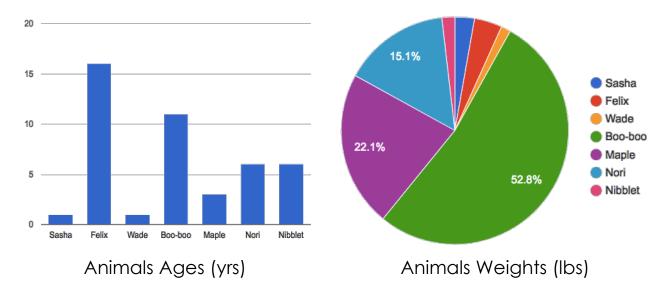

Use the Table below to help you answer the questions.

| name    | species | age | pounds |
|---------|---------|-----|--------|
| Sasha   | cat     | 1   | 6.5    |
| Felix   | cat     | 16  | 9.2    |
| Wade    | cat     | 1   | 3.2    |
| Boo-boo | dog     | 11  | 123    |
| Maple   | dog     | 3   | 51.6   |
| Nori    | dog     | 6   | 35.3   |
| Nibblet | rabbit  | 6   | 4.3    |

| 1. | Which animal(s) is/are the heaviest?  |    |
|----|---|----|
| 2. | Which animal(s) is/are the youngest?  |    |
| 3. | How much of the total weight comes from Maple?                                  |    |
| 4. | How much of the combined age comes from Nori?                                   |    |
| 5. | Would these questions be harder to answer if the table had 100 rows? If so, why | ۱Ś |
|    |   | _  |
|    |   |    |

## Visualizing Quantity

In the table below, there are two observations drawn from the following charts. Add two more.

| Based on a chart of                               | I notice that  |
|---|--|
| Based on a bar chart of 7 animals' ages           | Felix is by far the oldest                               |
| Based on a <b>pie chart</b> of 7 animals' weights | Boo-boo weighs more than the other six animals combined! |
| Based on a bar chart of 7 animals' ages           |  |
| Based on a pie chart of 7 animals' weights        |  |

Dogs are generally a lot bigger heavier than cats, so the shelter wants to look at a chart of *only* the dogs to determine who needs more exercise time. Define a function pie-dog-weight, which will make a pie chart showing the relative weights of all the dogs in the shelter.

## Bad Sample Tables!

For each word problem, a Sample Table must have (1) all the columns that matter, (2) a representative sample of the rows, and be in (3) random order. For each problem below, check the boxes to determine if the Sample Table meets those criteria.

| 1 | The shelter wan | to to know   | the median | ago of all | the cate |
|---|-----------------|--------------|------------|------------|----------|
|   | me mener wan    | IIS IO KIIOW | me median  | age or all | me cais, |

| name     | species | age | fixed | legs | pounds | weeks | Relevant columns              |
|----------|---------|-----|-------|------|--------|-------|-------------------------------|
| Sasha    | cat     | 1   | FALSE | 4    | 6.5    | 3     | Representative sample of rows |
| Mittens  | cat     | 2   | TRUE  | 4    | 7.4    | 5     | Random order                  |
| Sunfower | cat     | 5   | TRUE  | 4    | 8.1    | 10    |                               |

#### 2. The shelter wants a pie chart showing all the dogs' weight

| name    | species | age |
|---------|---------|-----|
| Fritz   | dog     | 4   |
| Wade    | cat     | 2   |
| Nibblet | rabbit  | 6   |
| Daisy   | dog     | 5   |

#### 3. Sort all the animals alphabetically by name

| name    | species | age | fixed | legs | pounds | weeks | Delevent celumen   |
|---------|---------|-----|-------|------|--------|-------|--|
| Ada     | dog     | 2   | TRUE  | 4    | 32     | 3     | <ul><li>Relevant columns</li><li>Representative sample of rows</li></ul> |
| Во      | dog     | 4   | TRUE  | 4    | 76.1   | 10    | □ Representative sample of rows □ Random order                           |
| Boo-boo | dog     | 11  | TRUE  | 4    | 123    | 10    | - Kanaom oraci   |

#### 4. Make a bar chart for all the fixed animals

| name  | species | age | fixed | legs | pounds | weeks | П | Relevant columns              |
|-------|---------|-----|-------|------|--------|-------|---|-------------------------------|
| Sasha | cat     | 1   | FALSE | 4    | 6.5    | 3     | П | Representative sample of rows |
|       |         |     |       |      |        |       |   | Random order                  |

Define a function bar-kitten-adoption, which takes in a Table of animals and creates a bar chart showing how many weeks it took for each kitten to be adopted

| Contract and Purpose  |                                   |
|---|-----------------------------------|

### Unit 7

- There are three ways to measure the "center" of a dataset, to talk about a whole column of data using just one number:
  - The mean of a dataset is the average of all the numbers
  - The median of a dataset is a value that is smaller than half the dataset, and larger than the other half
  - o The **modes** of a dataset are the numbers that appear the most often.
- Data Scientists can also measure the "variation" of a dataset using a **five number summary:** 
  - o The **minimum** the smallest value in the dataset
  - The first, or "lower" quartile (Q1) the median value that separates the first quarter of the values in the dataset from the second quarter
  - The second quartile (Q2) the median value which separates the entire dataset into "top" and "bottom" halves.
  - The third, or "upper" quartile (Q3) the median value that separates the third quarter of the values in the dataset from the fourth quarter
  - o The **maximum** the largest value in the dataset
- The five number summary can be used to draw a box-and-whisker plot.

# Summarizing Columns in Animals

| The column I choo   | se to measure is  | weeks              |                  |         |  |
|---|-------------------|--------------------|------------------|---------|--|
| Measures of Center The three measures for this column are:          |                   |                    |                  |         |  |
| Mean (Avera   | age)              | Median             | ٨                | Mode(s) |  |
|   |                   |                    |                  |         |  |
| Based on the diffe  | rences between    | mean and medic     | an, I conclude : |         |  |
|   |                   |                    |                  |         |  |
|   | My fiv            | easures of Variati | ary is:          |         |  |
| Minimum   | Q1                | Q2 (Median)        | Q3               | Maximum |  |
|   |                   |                    |                  |         |  |
| A box plot can be drawn from this summary on the number line below: |                   |                    |                  |         |  |
| From this summary   | and box-plot, I c | conclude:          |                  |         |  |
|   |                   |                    |                  |         |  |

The shelter wants a summary of the variation in ages among the dogs. Write a function called variation-dog-age that will take in a table of animals and produce a boxplot that shows this variation.

| Contract   | and Purpo   | ose  |          |      |        |        |               |          |     |      |      |       |                 |      |       |       |       |        |                |      |
|------------|-------------|------|----------|------|--------|--------|---------------|----------|-----|------|------|-------|-----------------|------|-------|-------|-------|--------|----------------|------|
|            |             |      | ::       |      |        |        |               |          |     |      |      | -     | <del>&gt;</del> |      |       |       |       |        |                |      |
|            |             |      |          |      |        |        |               |          |     |      |      | _     |                 |      |       |       |       |        |                |      |
|            |             |      |          |      |        |        |               |          |     |      |      |       |                 |      |       |       |       |        |                |      |
|            |             |      |          |      |        |        |               |          |     |      |      |       |                 |      |       |       |       |        |                |      |
| Example    | 8           |      |          |      |        |        |               |          |     |      |      |       |                 |      |       |       |       |        |                |      |

## Interpreting Variation

Consider the following list dataset, representing the annual income of ten people:

\$65k, \$12k, \$14k, \$280k, \$15k, \$22k, \$45k, \$34k, \$45k, \$175k

1. In the space below, rewrite this dataset in **sorted order**.

2. In the table below, compute the **measures of center** for this dataset.

| Mean (Average) | Median | Mode(s) |
|----------------|--------|---------|
|                |        |         |
|                |        |         |

3. In the table below, compute the **five number summary** of this dataset.

| Minimum | Q1 | Q2 (Median) | Q3 | Maximum |
|---------|----|-------------|----|---------|
|         |    |             |    |         |
|         |    |             |    |         |

4. On the number line below, draw a **box plot** for this dataset.

•

5. The following statements are correct...but misleading. Write down the reason why.

### Statement Why it's misleading

"They're rich! The average person makes more than \$70k dollars!"

"It's a middle-income list: the most common salary is \$45k/yr!"

"This group is really diverse, with people making as little as 12k and as much as \$280k!"

# Summarizing a Column in My Dataset

The column I choose to measure is

| Measures of Center The three measures for this column are:          |               |  |                  |         |  |
|---|---------------|--|------------------|---------|--|
| Mean (Ave   | rage)         | Median                                 |                  | Mode(s) |  |
|   |               |  |                  |         |  |
| Based on the diffe  | erences betw  | reen mean and medi                     | an, I conclude : |         |  |
|   |               |  |                  |         |  |
|   | N             | Measures of Variat My five-number summ | _                |         |  |
| Minimum   | Q1            | Q2 (Median)                            | Q3               | Maximum |  |
|   |               |  |                  |         |  |
| A box plot can be drawn from this summary on the number line below: |               |  |                  |         |  |
| From this summar  | y and box-plc | ot, I conclude:                        |                  |         |  |
|   |               |  |                  |         |  |
|   |               |  |                  |         |  |

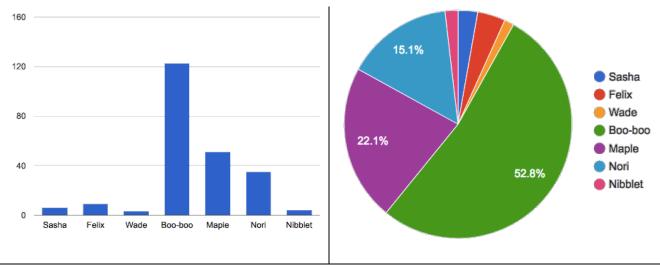

### Unit 8

- Frequency Bar charts show the number of rows belonging to a given category. The more rows in each category, the longer the bar. Frequency bar charts provide a visual representation of the frequency of values in a categorical column. Since categorical data cannot be ordered, there is no strict ordering of bars in a frequency bar chart.
- Histograms show the number of rows that fall within certain ranges, or "bins" of a
  dataset. The more rows that that fall within a particular "bin", the longer the bar.
  Histograms provide a visual representation of the frequency of values in a
  quantitative column. Quantitative data can be ordered, so the bars of a
  histogram are always sorted.
- When dealing with histograms, it's important to select a good **bin size**. If the bins are too small or too large, it is difficult to see the distribution in the dataset.

## Visualizing Quantity (Review)

Use the charts below to help you answer the questions.

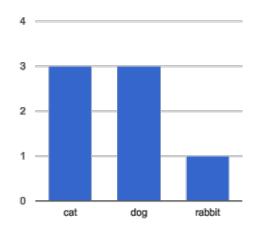

Animals Weights (lbs)

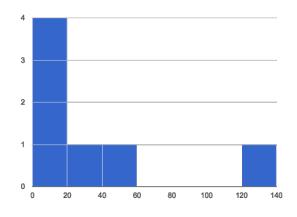

- 1. Which animal is the heaviest?
- 2. Which animal is the lightest?
- 3. How much of the total weight comes from Maple?
- 4. How much of the total weight comes from Nori?
- 5. Which chart did you use for questions 1 and 2?
- 6. Which chart did you use for questions 3 and 4?
- 7. Why are some questions easier to answer with one kind of chart or another?

## Visualizing Frequency

| name      | species  | age | pounds |
|-----------|----------|-----|--------|
| "Sasha"   | "cat"    | 1   | 6.5    |
| "Boo-boo" | "dog"    | 11  | 123    |
| "Felix"   | "cat"    | 16  | 9.2    |
| "Nori"    | "dog"    | 6   | 35.3   |
| "Wade"    | "cat"    | 1   | 3.2    |
| "Nibblet" | "rabbit" | 6   | 4.3    |
| "Maple"   | "dog"    | 3   | 51.6   |

- 1. How many cats are there?
- 2. How many dogs are there?
- 3. How many animals are between 3-6 years old?
- 4. How many weigh between 0-5 pounds?
- 5. Are there more animals weighing 0-5 than 6-10 pounds?
- 6. The charts below are based on the Sample Table above. What is each one measuring? Write down your guess underneath each one.

Define a function freq-bar-gender, which takes in a Table of animals and creates a frequency bar chart showing how many animals are male v. female.

| Contract and Purpose   |                                       |

|                     |               |
|                     |               |
|                     |               |

## Matching Charts to Questions

For each of the questions below, draw a line to the chart that will best answer it. (You may find that more than one question is best answered by the same chart!)

|                     | Are there more of the animals at the shelter fixed or unfixed?           | 1. |
|---------------------|--|----|
| Pie Chart           | How many weeks did each cat wait to be adopted?                          | 2. |
| Bar Chart           | How many male v. female dogs are there?                                  | 3. |
| bui Chan            | How many animals have 4 legs? 8? 3?                                      | 4. |
| Frequency Bar Chart | What percent of the total weight at the shelter is made up by Boo-boo?   | 5. |
|                     | What is the distribution of weights across all the animals older than 3? | 6. |
| Histogram           | How many animals are there of each species?                              | 7. |
|                     | Who waited the longest to be adopted?                                    | 8. |

#### Unit 9

- **Scatter Plots** show the relationship between two quantitative columns. Each row in the dataset is represented by a point, with one column providing the x-value and the other providing the y-value. The resulting "point cloud" makes it possible to look for a relationship between those two columns.
- If the points in a scatter plot appear to follow a pattern, it is possible that a relationship or **correlation** exists between those two columns.
- If there is a pattern to the points in a scatter plot, points that are far away from the pattern are called **outliers**.
- We can express this correlation by drawing line through the data cloud, so that
  the distance between the line and each of the points is as small as possible. This
  line is called the line of best fit or predictor function and allows us to make
  predictions based on the dataset.

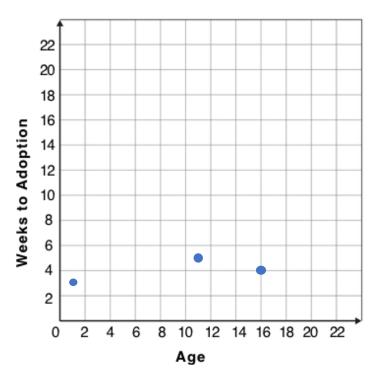

# (Dis)Proving a Claim

## "Younger animals are cuter, so they get adopted faster."

| Do you agree? If so, why?                                       |
|---|
| I hypothesize   |
|   |
|   |
|   |
|   |
|   |
|   |
|   |
|   |
| What would you look for in the dataset to see if you are right? |
|   |
|   |
|   |
|   |
|   |
|   |
|   |

## Creating a Scatter Plot

| name      | species  | age | weeks |
|-----------|----------|-----|-------|
| "Sasha"   | "cat"    | 1   | 3     |
| "Boo-boo" | "dog"    | 11  | 5     |
| "Felix"   | "cat"    | 16  | 4     |
| "Buddy"   | "lizard" | 2   | 24    |
| "Nori"    | "dog"    | 6   | 9     |
| "Wade"    | "cat"    | 1   | 2     |
| "Nibblet" | "rabbit" | 6   | 12    |
| "Maple"   | "dog"    | 3   | 2     |

- 1. For each row in the Sample Table on the left, add a point to the scatter plot on the right. The first 3 rows have been completed for you. Use the values from the age column for the x-axis, and values from the weeks column for the y-axis.
- 2. Do you see a pattern? Do the points seem to shift up or down as age increases? **Draw a line on the scatter plot to show this pattern**.
- 3. Does the line slope upwards or downwards?
- 4. Are the points close to the line? Spread out?

Define a function <code>dogs-age-weeks</code>, which takes in a Table of animals and creates a scatter plot of all the dogs, tracking their <code>age</code> on the x-axis and the number of <code>weeks</code> it took for them to be adopted on the y-axis.

### Unit 10

- Given a **predictor function** and a scatter plot, we can compute the error by adding the squares of all the distances between the function and each point in the plot. The error is called the **r**<sup>2</sup> **statistic**, which tells us how much of the variation in the y-axis can be explained by the x-axis.
- A strong correlation will have a large r<sup>2</sup>. A weak correlation will have a small r<sup>2</sup>.
- A **positive correlation** means the slope of the line of best fit is positive. A **negative correlation** means the slope is negative.
- **Linear Regression** is a way of computing the **line of best fit**, by taking a scatter plot and deriving the slope and y-intercept for a line that has the smallest possible r<sup>2</sup>.
- <u>Correlation is not causation!</u> Correlation only suggests that two measures are related, but does not tell us if one causes the other. For example, hot days are correlated with people running their air conditioners, air conditioners do not cause hot days!

## **Grading Predictors**

Below are the scatter plots for data sets A-D, with two different lines predictor lines drawn on top. For plots A-D:

- 1. Circle the plot with the line that fits better
- 2. Give the plot you circled a grade between 0 (no correlation) and 1 (perfect correlation)

# Findings in the animals Dataset

## Unit 11

#### Fake News!

**Every claim below is wrong!** Your job is to figure out why, by looking at the data.

|   | Data  | Claim  | Why it's wrong  |
|---|---|--|-----------------|
| 1 | The average player on a basketball team is 6'1".  | "Most of the players<br>on the team are taller<br>than 6'."  | Wily it's wiong |
| 2 | After performing linear regression on census data, a positive correlation (r <sup>2</sup> =0.18) was found between people's height and salary.                      | "Taller people get<br>paid more."  |                 |
| 3 | y=12.234x + -17.089; r-sq: 0.636  | "According to the predictor function indicated here, the value on the x-axis is will predict the value on the y-axis 63.6% of the time." |                 |
| 4 | 15  Sasha Felix Wade Boo-boo Maple Nori Bar Chart of Pet Ages   | "According to this bar chart, Felix makes up a little more than 15% of the total ages of all the animals in the dataset."                |                 |
| 5 | 20 40 60 80 100 120 140 160 180 Weight (pounds)   | "According to this histogram, most animals weigh between 40 and 60 pounds."  |                 |
| 6 | After performing linear regression, a negative correlation (r2=0.91) was found between the number of hairs on a person's head and their likelihood of owning a wig. | "Owning wigs causes people to go bald."  |                 |
